                                                                                                                                                                                                                                                                                                                                                                                                                           Surfand)

The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous.

The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.

Gene prediction is based on positional base preference in codons using a specially developed Hidden Markow Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp/

Jun/Cgilbu/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, qtg, ttg or (att)) which is preceded by an upstream initiation codon. If this cannot be identified we choose the most upstream initiation codon. If this cannot be identified we choose the most sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a consider of the considered clone. It may be shorter because we only sequence of the consider of the considered clone. It may be shorter because we arrange for a consider of the considered clone. It may be shorter because we arrange for a consider of the considered clone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         similar to TR:033236 (EMBL:298209) Mycobacterium tuberculosais hypothetical 49.8 kD protein mTCY174.11, len:450 aa: fasta scores: opt: 843 z-score: 874.7 E(): 0; 45.9% identity in 296 aa overlap. overlap. Contains Pfam match to entry PF00196 GerE,
Bacterial regulatory proteins, luxR family and match to
Prosite entry PS000625 Bacterial regulatory proteins, luxR
family signature. Also contains a possible
helix-turn-helix motif at residues 699. .720 (+3.25 SD)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon. If the cannot be identified we choose the most IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

The length in codons is given for each CDS.

The length highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the FramePlot program of Blbb et al., Gene 30:157-66(1984) as implemented at

```
correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon.
                                  carboxypeptidase; D-amino acid oxidase; ddah, dimethylarginine dimethylaminohydrolase; dehydrogenase; efflux protain; endonuclease; enoyl CoA hydratase; IPP isomerase; metallopeptidase; oxidoreductase; racemase; regulator; thiolase; transferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Submitted (07-APR-1999) Streptomyces coelicolor sequencing project, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CBIO 1SA E-mail: barrell@sanger.ac.uk Cosmids supplied by Prof. David A.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS. Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.
                                                                                                                                                                                           Streptomyces coelicolor A3(2).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for small overlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3 (bases 1 to 37245)

similar to many involved in antibiotic resistance egs.
TR:054381 (EMBL:X79146) from the lincomycin-production
gene cluster of streptomyces inconnesis 78-11 (578 aa)
fasta scores; opt: 1624, z-score: 1696.3, E(): 0, (50.3%
identity in 541 aa overlap). Contains two Pfam matches to
entry PF00005 ABC tran, ABC transporter, two Prosite
matches to PS00017 ATP/GTP-binding site motif A (P-loop)
and Prosite match to PS00211 ABC transporters family
signature. Also contains a possible coiled-coil region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RRPDVLLLDEPTNNLDVYARRRLYAAVESWPGVMVVVSHDRELLDRVDQIADLRAGSV

                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                The present sequence is a DNA (ATCC 21345) encoding S. griseus SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine agents, herbicides, antiparasitic agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.

The present sequence is a DNA (ATCC 23345) encoding S. griseus SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycelium in liquid oulture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antiblocits, antitumour agents, imminosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraline agents, herbicides, antiparastitc agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                300

The present sequence is a DNA (ATCC 21386) encoding S. goldeniensis SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycelium in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, eryme inhibitors, antimigraine agents, herbicides, antiparasitic agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mycelium; antibiotic, antitumour agent; immunosuppressive agent; hypocholesterolaemic agent; enzyme inhibitor; antimigraine agent; herbicide; antiparasitic agent; ruminant growth promoter; ATCC 21386; bioinsecticide; receptor agonist; antagonist; biomass; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a DNA (ATCC 23940) encoding S. netropsis SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesteroleamic agents, entitle agents, antimigraine agents, herbicides, antiparasitic agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.

                                                                                                                              The present sequence is a DNA (ATCC 3004) encoding S. albus G SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antiblotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, entitumour signal antimigraine agents, hebblicides, antiparaslitc agents, runnant growth promoters, bloinsecticides, receptor agonists and antagonists and biomass.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                08-MAR-2001.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      28-AUG-2001
```

polyketide synthase; biosynthesis; transgenic plant; insect resistance;

S. spinosa DNA fragment SEQ ID 1.

28-AUG-2001 (first entry)

Forosamine; trimethylrhamnose;

S

```
This invention describes a novel method nucleic acid (I) and its encoded polypeptide (II) containing at least one region that encodes an enzymatic activity involved in biosynthesis of spinosyns. (I) are used (i) to identify, inactivate or modulate genes involved in the biosynthesis of Identify, inactivate or modulate genes involved in the biosynthesis of adding forosamine or trimethylrhamnose to a spinosyn or polyketide adding forosamine or trimethylrhamnose to a spinosyn or polyketide caylycone; and (IV) for recombinant production of the corresponding enzymes, which are used for production of transgenic plants that express or derivatives, including production of transgenic plants that express (II) and thus have increased resistance to insects. (I) are also useful as markers for sequencing of the Saccharopolyspora spinosa genome. (II) are also be used to raise specific antibodies, useful for identifying companies and a gene bank. Cells transformed with (I) may produce to expression clones in a gene bank. Cells transformed with (I) may produce (II). This sequence represents a genomic DNA fragment of the S. Spinosa comment of the significant of the signifi
                                                                                                                                                                                                                                                                                                                                                             New nucleic acid encoding enzymes for spinosyn biosynthesis, useful for recombinant production of insecticidal spinosyns and their derivatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 45624 BP; 7933 A; 14913 C; 14940 G; 7838 T; 0 other;

This invention describes a novel method nucleic acid (I) and its encoded polypeptide (II) containing at least one region that encodes an enzymatic activity involved in biosynthesis of spinosyns. (I) are used (i) to clamify, inactivate or modulate genes involved in the biosynthesis of (II); (ii) to generate a library of polyketide synthases; (iii) for adding forosamine or trimethylrhamnose to a spinosyn or polyketide aliopersone; and (iv) for recombinant production of the corresponding enzymes, which are used for production of the corresponding enzymes, including production of transgenic plants that express of derivatives, including production of transgenic plants that express (II) and thus have increased resistance to insects. (I) are also useful as markers for sequencing of the Saccharopolyspora spinosa genome. (II) are macrolides with insecticidal, but not antibacterial, activity, and can also be used to raise specific antibodies, useful for identifying captone of the saccharopolyspora with (I) may produce (II) at significantly increased levels or produce new derivatives of genome which contains the coding regions for proteins involved in formation of the saccharopolyspora proteins involved in the second of the saccharopolyspora proteins procured the saccharopolyspora spinosa spi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   24714 gaggcaggcgaaggcgatgtgcggtcggcc--ctcgacggggttttccggggttggtc 24770

                                                                                                                                                                                                                                                                                                                                                                           AAQ88151 encodes AAR74619 Xanthomonas campestris L-glutamyl tRNA reductase. The DNA as part of an expression vector can be used to transform a host cell, for the recombinant prodn. of the protein. The protein can be used in the prodn. of vitamin B12, glutamic acid-1-semialdehyde, 5-aminolevulinate, haem, chlorophyll and
                                                                                                                                                                                                                                                                                                              DNA fragment encoding L-glutamyl tRNA reductase - derived from Xanthomonas sp., useful for production of 5-amino:levulinate, vitamin-B12, chlorophyll, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

SsgA reduces branching and fragment septation and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, entitumour spents, antimigraine agents, herbicides, antiparaslit agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                       ssgA: liquid culture; filamentous bacteria; secondary metabolite; mycelium; antibiotic, antitumour agent; immunosuppressive agent; hypocholesterolaemic agent; enzyme inhibitor; antimigraine agent; herbicide; antiparasitic agent; ruminant growth promoter; ATCC 23345; bioinsecticide; receptor agent; antagonist; blomass; ds.

Sequences AAX37293-298 represent nucleic acids encoding alpha-amylase variants (AAY17904-117909). The variants are derived from the Pseudomonas sp. KO-8940-derived maltopentaose-forming amylase (Shida, O. et al., Blosci. Blotech, Blochem. Vol. 56, 76-80, 1992 ). The variants have a replacement of the 57th or the 130th amino acid residue in the sequence as compared to the wild-type. The sequences are deposited under the accession numbers FERM BP-6116, 6119, 6115, 6117, 6118 or 6114. The variants can be used to transform plants to produce maltopentaose. The enzymes prepared from the alpha-amylase variants produce maltopentaose

The variants are derived from the Pseudomonas sp. KO-8940-derived maltopentaose-forming amylase (Shida, O. et al, Biosci. Biotech, Biochem. Vol. 56, 76-80, 1992). The variants have a replacement of the 57th or the 130th amino acid residue in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence as compared to the wild-type. The sequences are deposited under the accession numbers FERM BP-6116, 6119, 6115, 6117, 6117, 6118 or 6114. The variants can be used to transform plants to produce maltopentaose. The enzymes prepared from the alpha-amylase variants produce maltopentaose

The variants are derived from the Pseudomonas sp. KO-8940-derived maltopentaose-forming amylase (Shida, O. et al., Biosci. Biochem. Vol. 56, 76-80, 1992 ). The variants have a replacement of the 57th or the 130th amino acid residue in the sequence as compared to the wild-type. The sequences are deposited under the accession numbers FERM BP-6116, 6119, 6115, 6117, 6118 or 6114. The variants can be used to transform plants to produce maltopentaose. The enzymes prepared from the alpha-amylase variants produce maltopentaose in a high yield.

Sequences AAX37293-298 represent nucleic acids encoding alpha-amylasse variants (AAX17904-Y17909). The variants are derived from the Pseudomonas sp. KO-8940-derived maltopentaose-forming amylase (Shida, Oet al, Blosci. Blotech, Blochem. Vol. 56, 76-80, 1992). The variants have a replacement of the 57th or the 130th aminon acid residue in the sequence as compared to the wild-type. The sequences are deposited under the accession numbers FERM BP-6116, 6119, 6115, 6117, 6118 or 6114. The enzymes prepared from the alpha-amylase variants produce maltopentaose. The in a high yield.
                                                                                                                                                                                      ccggacgacaagctcgtgccgctcggccaggagcacacgctgggtgacttcgacggcaa 356

The variants are derived from the pseudomonas sp. Ko-8940-derived maltopentaose-forming amylase (Shida, O. et al., Blosci. Blochem. Vol. 56, 76-80, 1992). The variants have a replacement of the 57th or the 130th amino acid residue in the sequence as compared to the wild-type. The sequences are deposited under the accession numbers FERM BP-6116, 6119, 6115, 6117, 6118 or 6114. The variants can be used to transform plants to produce maltopentaose. The enzymes prepared from the alpha-amylase variants produce maltopentaose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New alpha-amylase gene - useful for production of malto-pentaose

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1, A

Patent No. 6087147

GENERAL INFORMATION:
APPLICANT: ITO, YOSHIFUMI
TITLE OF INVENTION: A-AMYLASE GENE HAVING ABI
TITLE OF INVENTION: TRANSFORMANT
TITLE OF INVENTION: TRANSFORMANT
TITLE REPREBUCE: 8361-0003-0
CURRENT APPLICATION NUMBER: US/09/017,706A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TYPE: DNA
ORGANISM: Pseudomonas sp., Strain KO-8940
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         OTHER INFORMATION: MUTATED GENOMIC DNA

Patent No. 6087147
GENERAL INFORMATION:
APPLICART: ITO. YOSHIFUMI
TITLE OF INVENTION: A-AMYLASE GENE HAVING ABILITY FOR HIGHLY PRODUCING
TITLE OF INVENTION: MALTOPENTAOSE, VECTOR CONTAINING SAID GENE AND
TITLE OF INVENTION: TRANSFORMANT
FILE REFERENCE: 8361-0003-0
CURRENT APPLICATION NUMBER: US/09/017,706A
CURRENT FILING DATE: 1998-02-05
EARLIER PILING DATE: 1998-10-21

                                                                                                                                                                                                                                                        COUPTIER EADABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: ELBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/387,942C
FILING DATE: 09-MAY-1995
CLEASIFICATION: 09-MAY-1995
ATTORNEY/AGRAT INFORMATION:
NAME: MURPHY JR, GERALD M.
REGISTRATION NUMBER: 1809-106P
TELECOMMUNICATION INFORMATION:
TELECOMMUNICATION INFORMATION:
TELECOMMUNICATION INFORMATION:
TELECOMMUNICATION OF 7:
SEQUENCE CHARACTERISTICS:
LENGTH: 1155 base pairs
TYPE: nucleic acid
TYPE: nucleic acid
TYPE: nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       US-07-642-734C-1/C

- Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Googawa and melanogaster in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RRCI-99 and was constructed by partial ESCRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2: cn bw sp, the same strain used for the BDGP's Pl and bow to order individual BAC clones, the entire library or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-end sequence was carried out as part of a

collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila

melanogaster genome using these BACs. For further information

please see http://www.fruitfly.org The BDGP Drosophila

melanogaster BAC library was prepared by Kazutoyo Osoegaw and

Aaron Mammoser in Pieter de Jong's laboratory in the Department of

Cancer Genetics at the Roswell Park Cancer Institute in Buffalo,

NY. The library is named RPCI-98 and was constructed by partial

ECORI digestion of Drosophila DNA provided by the BDGP from the

isogenic strain y2; cn bw sp, the same strain used for the BDGP's

pl and EST libraries. A more detailed description of the library

and how to order individual BAC clones, the entire library, or

filters for hybridization from the BACPAC Resource Center can be

found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

                                                                                   on rice as their primary source of carbohydrate.

Monocotyledonous rice is a diploid plant (2n-24) with a haploid genome equivalent of All Mbp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety using EcoRI as the cloning enzyme. The library contains 55,296 clones with an average insert size of 121 Kb providing approximatley 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Three high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening and can be requested from the clemson University BAC/EET Resource Center (www.genome.cdu)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Drosophila melanogaster genome survey sequence T7 end of BAC # BACK14N09 of RPCI-98 library from Drosophila melanogaster (fruit ALD), genomic survey sequence.

collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BAGs. For further information please see http://www.fruitiy.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoss in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2: on bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

/note="Vector: pZero-2 (Invitrogen); Site_l: ECORV;
Genomic DNA was isolated from stationary phase cells. For this library, DNA was sheared to give a tight size distribution of 1-1.5kb fragments, blunt-ended with T4 DNA polymerase, dephosphorylated with Shrimp Alkaline
Phosphatase and ligated into pZero-2 vector's ECORV site."
